

Tutorial Assignment

Q1. What is Power BI Desktop? Mention any two uses of Power BI Desktop.

Power BI Desktop is a business intelligence (BI) and data visualization tool developed by Microsoft.

Two uses of Power BI Desktop:

- *Connecting to multiple data sources.*
 - *Transforming and cleaning data.*
-

Q2. Name the three main views available in Power BI Desktop. Write one purpose of each view.

The three main views are:

1. **Report View:** *It serves as the primary canvas for building, designing, and arranging visualizations and reports.*
 2. **Data View:** *It displays loaded data in a table format, allowing for sorting, filtering, and creating DAX measures.*
 3. **Model View:** *It visualizes and manages data relationships, tables, measures, and data model layouts.*
-

Q3. What is the purpose of the Home Ribbon? List any five commands available in it.

The purpose of the Home Ribbon is to serve as a central hub accessible in all views for data acquisition, refreshing, data transformation, and publishing reports.

Five commands available in the Home Ribbon:

1. *Get data*
2. *Transform data*

3. Refresh
 4. Publish
 5. Open/Access the Query Editor
-

Q4. Differentiate between the Fields Pane and the Visualizations Pane.

- **Fields Pane:** Shows the loaded data tables and allows users to expand each table to view all the available fields within those tables.
 - **Visualizations Pane:** Shows different charts and visualization types and allows users to create customized visual reports
-

Q5. What is the purpose of the Filters Pane? Name the three types of filters available in Power BI.

Purpose of the Filters Pane:

Helps you show only the data you need without cluttering your main report page with extra visual tools.

Keeps data clean and easy to read.

Lets report makers lock or hide filters so users see consistent results.

Three Types of Filters:

Visual-level filters , Page-level filters , Report-level filters.

Q6. Explain the difference between a Slicer and a Filter in Power BI.

*Slicers and Filters in Power BI differ primarily in their placement, design purpose, and user interaction. A **Slicer** is an interactive, on-canvas visual element designed specifically for report consumers. Because it sits directly on the report page alongside charts and graphs, it takes up valuable layout space but offers a highly visible, user-friendly way for everyday users to click buttons, open dropdowns, or slide through date ranges to slice the data on that specific page.*

*In contrast, a **Filter** lives tucked away inside the dedicated Filters Pane on the right side of the screen. It is built primarily for report creators to manage data*

logic behind the scenes, allowing them to clean up information quietly—such as hiding blank rows—or lock specific data restrictions so end-users cannot alter them. Furthermore, while a slicer typically impacts only the page it is on, the Filters Pane offers broader control, letting creators apply precise logic to a single visual, an entire page, or globally across every page in the report without cluttering the canvas.

Q7. Write the steps to import an Excel file into Power BI Desktop.

1. From the **Home** ribbon, select **Get data**.
 2. In the **Get Data** window that appears, select **Excel** and then select the **Connect** button.
 3. Provide the location of the Excel file, select the file, and then select **Open**.
 4. In the **Navigator** window, choose which data you would like to load by marking the checkboxes beside each table you want to import.
 5. Select **Load** to import the data into Power BI.
-

Q8. Match the following:

- a. Report View — ii. Creates and designs reports
 - b. Data View — i. Displays raw data in tabular form
 - c. Model View — iii. Shows relationships between tables
 - d. Fields Pane — iv. Contains tables, columns, and measures
 - e. Visualizations Pane — v. Used to create charts and visuals
-

Q9. State whether the following statements are True or False:

1. Report View is used to create dashboards. — **True**
2. Model View displays relationships between tables. — **True**
3. The Home Ribbon is used only for formatting charts. — **False**
4. A Slicer is an interactive filtering visual. — **True**

5. Data View is used to inspect imported data. — **True**

Q10. Why is it important to understand the Power BI interface before creating reports? Explain your answer in 4–5 sentences.

Understanding the Power BI interface is essential because it allows users to systematically navigate from data loading to final visualization. By mastering components like the Home Ribbon, users know exactly where to connect to data sources and access data transformation options. Recognizing the separate roles of the Report, Data, and Model views ensures that a developer can inspect tables and manage data relationships effectively before trying to build graphics. Ultimately, familiarity with areas like the Fields pane makes dragging and arranging fields intuitive rather than confusing. This baseline layout knowledge saves development time and prevents structural data errors during report creation.
